Name:

1. ADDITION AND SUBTRACTION

To add or subtract fractions, they must have the same *denominator*. To add several fractions, this common denominator will be the least number into which each given denominator will divide evenly.

Example:

Add
$$\frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5}$$

Solution:

The common denominator must contain two factors of 2 to accommodate the 4, and also a factor of 3 and one of 5. That makes the least common denominator 60. Rename each fraction to have 60 as the denominator by dividing the given denominator into 60 and multiplying the quotient by the given numerator.

$$\frac{30}{60} + \frac{20}{60} + \frac{15}{60} + \frac{12}{60} = \frac{77}{60} = 1\frac{17}{60}$$

When only two fractions are being added, a shortcut method can be used: $\frac{a}{b} + \frac{c}{d} = \frac{ad+bc}{bd}$. That is, in order to add two fractions, add the two cross products and place this sum over the product of the given denominators.

Example:

$$\frac{4}{5} + \frac{7}{12}$$

Solution:

$$\frac{4(12)+5(7)}{5(12)} = \frac{48+35}{60} = \frac{83}{60} = 1\frac{23}{60}$$

A similar shortcut applies to the subtraction of two fractions:

$$\frac{a}{b} - \frac{c}{d} = \frac{ad - bc}{bd}$$

Example:

$$\frac{4}{5} - \frac{7}{12} = \frac{4(12) - 5(7)}{5(12)} = \frac{48 - 35}{60} = \frac{13}{60}$$

Work out each problem. Circle the letter that appears before your answer. 1. The sum of $\frac{1}{2} + \frac{2}{3} + \frac{3}{4}$ is 4. Subtract $\frac{3}{5}$ from $\frac{9}{11}$. $\frac{6}{9}$ (A) $-\frac{12}{55}$ (A) (B) $\frac{23}{12}$ (C) $\frac{23}{36}$ (D) $\frac{6}{24}$ (B) $\frac{12}{55}$ (C) 1 (D) $\frac{3}{8}$ (E) $\frac{3}{4}$ (E) $2\frac{1}{3}$ 5. Subtract $\frac{5}{8}$ from the sum of $\frac{1}{4}$ and $\frac{2}{3}$. 2. The sum of $\frac{5}{17}$ and $\frac{3}{15}$ is $\frac{126}{255}$ (A) (A) 2 $\frac{40}{255}$ $\frac{8}{32}$ $\frac{40}{32}$ (B) $\frac{3}{2}$ (B) (C) $\frac{11}{24}$ (C) (D) $\frac{8}{15}$ (D) $\frac{126}{265}$ (E) $\frac{7}{24}$ (E) 3. From the sum of $\frac{3}{4}$ and $\frac{5}{6}$ subtract the sum of $\frac{1}{4}$ and $\frac{2}{3}$. (A) 2 $\frac{1}{2}$ (B)

 $\frac{36}{70} \\
\frac{2}{3} \\
\frac{5}{24}$

(C)

(D)

(E)

2. MULTIPLICATION AND DIVISION

In multiplying fractions, always try to divide out any common factor of any denominator with any numerator to keep your numbers as small as possible. Remember that if all numbers divide out in the numerator, you are left with a numerator of 1. The same goes for the denominator. If all numbers in both numerator and denominator divide out, you are left with $\frac{1}{1}$ or 1.

Example:

Multiply
$$\frac{3}{5} \cdot \frac{15}{33} \cdot \frac{11}{45}$$

Solution:

$$\frac{\cancel{3}}{\cancel{5}} \cdot \frac{\cancel{15}}{\cancel{15}} \cdot \frac{\cancel{11}}{\cancel{15}} = \frac{1}{15}$$

In dividing fractions, we multiply by the multiplicative inverse.

Example:

Divide
$$\frac{5}{18}$$
 by $\frac{5}{9}$

Solution:

$$\frac{\cancel{5}}{\cancel{18}} \cdot \frac{\cancel{9}}{\cancel{5}} = \frac{1}{2}$$

Work out each problem. Circle the letter that appears before your answer.

**0	or out each problem. Chere the fetter that appears before your answer.						
1.	Find the product of $\frac{3}{2}$, 6, $\frac{4}{9}$, and $\frac{1}{12}$.	4.	Find $\frac{2}{3}$ of $\frac{7}{12}$.				
	(A) 3		(A) $\frac{7}{8}$				
	(B) $\frac{1}{3}$		(B) $\frac{7}{9}$				
	(C) $\frac{14}{23}$		(C) $\frac{8}{7}$				
	(D) $\frac{1}{36}$		(D) $\frac{8}{9}$				
	(E) $\frac{5}{12}$		(E) $\frac{7}{18}$				
2.	Find $\frac{7}{8} \cdot \frac{2}{3} \div \frac{1}{8}$.	5.	Divide 5 by $\frac{5}{12}$.				
	(A) $\frac{3}{14}$		(A) $\frac{25}{12}$				
	(B) $\frac{7}{96}$		(B) $\frac{1}{12}$				
	(C) $\frac{21}{128}$		(C) $\frac{5}{12}$				
	(D) $\frac{14}{3}$		(D) 12				
	(E) $\frac{8}{3}$		(E) $\frac{12}{5}$				
3.	$\frac{3}{5} \div \left(\frac{1}{2}, \frac{3}{10}\right)$ is equal to						
	(A) 4						
	(B) $\frac{1}{4}$						
	(C) $\frac{12}{5}$						
	(D) $\frac{5}{12}$						
	(E) $\frac{12}{15}$						

3. SIMPLIFYING FRACTIONS

All fractional answers should be left in simplest form. There should be no factor that can still be divided into numerator and denominator. In simplifying fractions involving very large numbers, it is helpful to tell at a glance whether or not a given number will divide evenly into both numerator and denominator. Certain tests for divisibility assist with this.

If a number is divisible by	Then
2	its last digit is 0, 2, 4, 6, or 8
3	the sum of the digits is divisible by 3
4	the number formed by the last 2 digits is divisible by 4
5	the last digit is 5 or 0
6	the number meets the tests for divisibility by 2 and 3
8	the number formed by the last 3 digits is divisible by 8
9	the sum of the digits is divisible by 9

Example:

By what single digit number should we simplify $\frac{135,492}{428,376}$?

Solution:

Since both numbers are even, they are at least divisible by 2. The sum of the digits in the numerator is 24. The sum of the digits in the denominator is 30. Since these sums are both divisible by 3, each number is divisible by 3. Since these numbers meet the divisibility tests for 2 and 3, they are each divisible by 6.

Example:

	43,672
Simplify to simplest form:	52,832

Solution:

Since both numbers are even, they are at least divisible by 2. However, to save time, we would like to divide by a larger number. The sum of the digits in the numerator is 22, so it is not divisible by 3. The number formed by the last two digits of each number is divisible by 4, making the entire number divisible by 4. The numbers formed by the last three digits of each number is divisible by 8. Therefore, each number is divisible by 8. Dividing by 8, we have $\frac{5459}{6604}$. Since these numbers are no longer even and divisibility by 3 was ruled out earlier, there is no longer a single digit factor common to numerator and denominator. It is unlikely, at the level of this examination, that you will be called on to divide by a two-digit number.

Work out each problem. Circle the letter that appears before your answer.

1. Which of the following numbers is divisible by 5 and 9?

(A) 42,235

- (B) 34,325
- (C) 46,505
- (D) 37,845
- (E) 53,290
- 2. Given the number 83,21*p*, in order for this number to be divisible by 3, 6, and 9, *p* must be
 - (A) 4
 - (B) 5
 - (C) 6
 - (D) 0
 - (E) 9
- 3. If *n*! means $n(n 1)(n 2) \dots (4)(3)(2)(1)$, so that 4! = (4)(3)(2)(1) = 24, then 19! is divisible by
 - I. 17
 - II. 54
 - III. 100
 - IV. 39
 - (A) I and II only
 - (B) I only
 - (C) I and IV only
 - (D) I, II, III, and IV
 - (E) none of the above

4. The fraction $\frac{432}{801}$ can be simplified by dividing numerator and denominator by

- (A) 2
- (B) 4
- (C) 6
- (D) 8
- (E) 9
- 5. The number 6,862,140 is divisible by
 - I. 3
 - II. 4
 - III. 5
 - (A) I only
 - (B) I and III only
 - (C) II and III only
 - (D) I, II, and III
 - (E) III only

4. OPERATIONS WITH MIXED NUMBERS

To add or subtract mixed numbers, it is again important to find common denominators. If it is necessary to borrow in subtraction, you must borrow in terms of the common denominator.

Example:

$$23\frac{1}{3}-6\frac{2}{5}$$

Solution:

$$23\frac{1}{3} = 23\frac{5}{15}$$
$$-6\frac{2}{5} = -6\frac{6}{15}$$

Since we cannot subtract $\frac{6}{15}$ from $\frac{5}{15}$, we borrow $\frac{15}{15}$ from 23 and rewrite our problem as

$$22\frac{20}{15}$$
$$-6\frac{6}{15}$$

In this form, subtraction is possible, giving us an answer of $16\frac{14}{15}$.

Example:

Add
$$17\frac{3}{4}$$
 to $43\frac{3}{5}$

Solution:

Again we first rename the fractions to have a common denominator. This time it will be 20.

$$17\frac{3}{4} = 17\frac{15}{20}$$

$$\frac{+43\frac{3}{5}}{5} = \frac{+43\frac{12}{20}}{20}$$
When adding, we get a sum of 60 $\frac{27}{20}$, which we change to 61 $\frac{7}{20}$

To multiply or divide mixed numbers, always rename them as improper fractions first.

Example:

Multiply
$$3\frac{3}{5} \cdot 1\frac{1}{9} \cdot 2\frac{3}{4}$$

Solution:

$$\frac{\overset{2}{\cancel{18}}}{\cancel{5}} \cdot \frac{\overset{2}{\cancel{10}}}{\cancel{9}} \cdot \frac{\cancel{11}}{\cancel{4}} = 11$$

Example:

Divide
$$3\frac{3}{4}$$
 by $5\frac{5}{8}$

Solution:

$$\frac{15}{4} \div \frac{45}{8} = \frac{15}{\cancel{4}} \cdot \frac{\cancel{8}}{\cancel{8}} = \frac{2}{3}$$

Exercise 4

Work out each problem. Circle the letter that appears before your answer. $1 - \Sigma^2 + 1 + 2^2 - 1 + 2^3$

1.	Find the sum of $1\frac{1}{6}$, $2\frac{2}{3}$, and $3\frac{3}{4}$. 4.	Divide $17\frac{1}{2}$ by 70.
	(A) $7\frac{5}{12}$	(A) $\frac{1}{4}$
	(B) $6\frac{6}{13}$	(B) 4
	(C) $7\frac{7}{12}$	(C) $\frac{1}{2}$
	(D) $6\frac{1}{3}$	(D) $4\frac{1}{2}$
	(E) $7\frac{1}{12}$	(E) $\frac{4}{9}$
2.	Subtract $45\frac{5}{12}$ from 61.	Find $1\frac{3}{4} \cdot 12 \div 8\frac{2}{5}$.

12	5. Find $1\frac{3}{4} \cdot 12 \div 8\frac{2}{5}$
(A) $15\frac{7}{12}$	4 5
	(A) $\frac{2}{5}$
(B) $15\frac{5}{12}$	-
(C) $16\frac{7}{12}$	(B) $\frac{5}{288}$
	(C) $2\frac{1}{5}$
(D) $16\frac{5}{12}$	5
	(D) $\frac{1}{2}$
(E) $17\frac{5}{12}$	-
Find the product of $32\frac{1}{2}$ and $5\frac{1}{5}$.	(E) $2\frac{1}{2}$
(A) 26	
(B) 13	

(B) 15 (C) 169

3.

- (D) $160\frac{1}{10}$
- (E) $160\frac{2}{7}$

5. COMPARING FRACTIONS

There are two methods by which fractions may be compared to see which is larger (or smaller).

Method I—Rename the fractions to have the same denominator. When this is done, the fraction with the larger numerator is the larger fraction.

Example:

٦

Which is larger,
$$\frac{5}{6}$$
 or $\frac{8}{11}$?

Solution:

The least common denominator is 66. $\frac{5}{6} = \frac{55}{66} \qquad \frac{8}{11} = \frac{48}{66}$

Therefore, $\frac{5}{6}$ is the larger fraction.

Method II—To compare $\frac{a}{b}$ with $\frac{c}{d}$, compare the cross products as follows:

If
$$ad > bc$$
, then $\frac{a}{b} > \frac{c}{d}$
If $ad < bc$, then $\frac{a}{b} < \frac{c}{d}$
If $ad = bc$, then $\frac{a}{b} = \frac{c}{d}$
Using the example above, to compare $\frac{5}{6}$ with $\frac{8}{11}$, compare $5 \cdot 11$ with $6 \cdot 8$. Since $5 \cdot 11$ is greater,
 $\frac{5}{6}$ is the larger fraction.

Sometimes, a combination of these methods must be used in comparing a series of fractions. When a common denominator can be found easily for a series of fractions, Method I is easier. When a common denominator would result in a very large number, Method II is easier.

Example:

Which of the following fractions is the largest?

(A) $\frac{3}{5}$ (B) $\frac{21}{32}$ (C) $\frac{11}{16}$ (D) $\frac{55}{64}$ (E) $\frac{7}{8}$

Solution:

To compare the last four, we can easily use a common denominator of 64.

 $\frac{21}{32} = \frac{42}{64} \qquad \frac{11}{16} = \frac{44}{64} \qquad \frac{55}{64} \qquad \frac{7}{8} = \frac{56}{64}$ The largest of these is $\frac{7}{8}$. Now we compare $\frac{7}{8}$ with $\frac{3}{5}$ using Method II. $7 \cdot 5 > 8 \cdot 3$; therefore, $\frac{7}{8}$ is the greatest fraction.

Work out each problem. Circle the letter that appears before your answer.

W	work out each problem. Chere the fetter that appears before your answer.						
1.	Arrange these fractions in order of size, from	4.	Which of the following fractions is closest to $\frac{3}{4}$?				
	largest to smallest: $\frac{4}{15}, \frac{2}{5}, \frac{1}{3}$.		(A) $\frac{1}{2}$				
	(A) $\frac{4}{15}, \frac{2}{5}, \frac{1}{3}$		(B) $\frac{7}{12}$				
	(B) $\frac{4}{15}, \frac{1}{3}, \frac{2}{5}$		(C) $\frac{5}{6}$				
	(C) $\frac{2}{5}, \frac{1}{3}, \frac{4}{15}$		(D) $\frac{11}{12}$				
	(D) $\frac{1}{3}, \frac{4}{15}, \frac{2}{5}$		19				
	(E) $\frac{1}{3}, \frac{2}{5}, \frac{4}{15}$	_	1				
	3 5 15	5.	Which of the following fractions is closest to $\frac{1}{2}$?				
2.	Which of the following fractions is the smallest?		(A) $\frac{5}{12}$				
	(A) $\frac{3}{4}$		(B) $\frac{8}{15}$				
	(B) $\frac{5}{6}$		(C) $\frac{11}{20}$				
	(A) $\frac{3}{4}$ (B) $\frac{5}{6}$ (C) $\frac{7}{8}$		(D) $\frac{31}{60}$				
	(D) $\frac{19}{24}$		(E) $\frac{7}{15}$				
	(E) $\frac{13}{15}$						
3.	Which of the following fractions is the largest?						
	- •						

(A) $\frac{3}{5}$ (B) $\frac{7}{10}$ (C) $\frac{5}{8}$ (D) $\frac{3}{4}$ (E) $\frac{13}{20}$

6. COMPLEX FRACTIONS

To simplify complex fractions, fractions that contain fractions within them, multiply every term by the smallest number needed to clear all fractions in the given numerator and denominator.

Example:

$$\frac{\frac{1}{6} + \frac{1}{4}}{\frac{1}{2} + \frac{1}{3}}$$

Solution:

The smallest number into which 6, 4, 2, and 3 will divide is 12. Therefore, multiply every term of the fraction by 12 to simplify the fraction.

$$\frac{2+3}{6+4} = \frac{5}{10} = \frac{1}{2}$$

Example:

$$\frac{\frac{3}{4} - \frac{2}{3}}{1 + \frac{1}{2}}$$

Solution:

Again, we multiply every term by 12. Be sure to multiply the 1 by 12 also.

 $\frac{9-8}{12+6} = \frac{1}{18}$

Exercise 6

Work out each problem. Circle the letter that appears before your answer.

1.	Write as a fraction in simplest form:		$\frac{\frac{2}{3} + \frac{1}{6} + \frac{1}{4}}{\frac{2}{3} - \frac{1}{2}}$	2.	Simp	blify: $\frac{\frac{5}{6} - \frac{2}{3}}{\frac{5}{12} - \frac{1}{6}}$
	(A)	$\frac{13}{2}$			(A)	$\frac{5}{12}$ $\frac{5}{6}$
	(B)	$\frac{7}{2}$			(B)	$\frac{5}{6}$
	(C)	$\frac{13}{4}$			(C)	$\frac{2}{3}$
	(D)	$\frac{4}{13}$			(D) (E)	$\frac{\frac{1}{6}}{\frac{7}{12}}$
					(L)	12
	(E)	$\frac{49}{12}$
